Pyramidal Wave off South Japan

South Africa

NOAA VESSEL SWAMPED BY ROGUE WAVE

At 4/11/2000, the 56-foot R/V Ballena capsized in a rogue wave south of Point Arguello, California. The Channel Islands National Marine Sanctuary's research vessel was engaged in a routine side-scan sonar survey for the U. S. Geological Survey of the seafloor along the 30-foot-depth contour approximately 1/4 nautical mile from the shore. The crew of the R/V Ballena consisted of the captain, LCdr. Pickett, research scientist Dr. Cochrane, and research assistant, Boyle. According to NOAA, the weather was good, with clear skies and glassy swells. The actual swell appeared to be 5-7 feet. At approximately 11:30 a.m., Pickett and Boyle said they observed a 15-foot swell begin to break 100 feet from the vessel. The wave crested and broke above the vessel, caught the Ballena broadside, and quickly overturned her. All crewmembers were able to escape the overturned vessel and deploy the vessel's liferaft. The crew attempted to paddle to the shore, but realized the possibility of navigating the raft safely to shore was unlikely due to strong near-shore currents. The crew abandoned the liferaft approximately 150 feet from shore and attempted to swim to safety. The crew climbed the rocky cliffs along the shore. **The R/V Ballena is a total loss.**

In October, 1998, thirteen students in the Bamfield Marine Station Fall Program were taken on a field trip to Kirby Point, a wave-beaten peninsula on the southwest corner of Dianna Is. (Barkley Sound, Vancouver Island, British Columbia), to view the **large open-ocean swell breaking on the shore the day after a very large storm** had passed through. The students split into two groups and sat atop two adjacent rock outcrops, at least **25 meters above sea level**

After about **45 minutes** of wave watching, one student tried to capture the feel of these huge waves thundering onto the shore by taking **three pictures** in quick succession of what looked to be a nice example of a large wave as it started to break

3) The rogue wave breaks over the students who were at least 25 meters above sea level (approx. 2 sec after the previous picture)

In these stormy seas, **45 minutes** was not enough time to judge how high to stay on the shore to avoid being hit by a breaking wave. In the preceding **45 minutes**, the next closest wave had only reached to within **5 m** of the students

Almost every year people are killed by rogue waves on the west coast of Vancouver Island

Had any of these students been even a few meters lower on the shore, they might have been washed off

Freak wave kills Japanese skipper

September 01, 2006 03:30pm

Article from: AAP

THE captain of a Japanese tuna fishing boat has been killed by a freak wave in international waters off the West Australian coast.

The 53-year-old captain and three crew members were thrown against the bulkhead of the 379 tonne tuna fishing boat, Hoshin Maru, when it was hit by a wave in the Southern Ocean.

The incident happened on Monday about 10pm WA police Sergeant Graham Clifford said.

"The boat was hit by a freak wave and a number of the fishermen including the captain were thrown against the bulkhead and he received injuries that caused his death," Sgt Clifford said.

The crew members received minor injuries, he said.

The boat has now docked in Fremantle and authorities are investigating, he said.

It is believed the captain's family have arrived in Perth.

A post-mortem examination will be carried out.

Recovery Mission Called Off September 15, 2006 USA

CAPE ELIZABETH, Maine -- The Maine Marine Patrol has called off its search for a missing lobsterman who disappeared Wednesday when his boat capsized after being hit by a rogue wave.

Video: Still No Sign Of Missing Lobsterman

The April Lee was struck by a rogue wave that might have been kicked up by the remnants of Hurricane Florence late Wednesday morning off McKenney Point, sending its crew into the waters of Seal Cove.

Charles Currier said he was hauling traps alongside the boat's owner, Steve Smith, 50, and his son when the wave hit.

Fisherman dies in freak accident
Friday, September 22 2006

A FREAK accident on a pirogue off the shores of Chatham beach resulted in the death of a 21-year-old fisherman yesterday morning.

Police said around 6.30 am, fisherman Dinanath Ramrattan, 21, of Iros Fores Village was aboard a pirogue in company with another fisherman when he struck his head against the boat which was rocking violently after being buffeted by large waves.

As a dazed Ramrattan tried to keep his balance, another wave swept over the pirogue slamming him into the bow of the boat and he fell into the sea. His companion quickly pulled him from the water and rode the pirogue to shore.

An unconscious Ramrattan was taken to the Point Fortin District Hospital where he was pronounced dead on arrival. Insp Ramsey and Cpl Gangaram visited the scene and recorded a statement from the other fisherman.

Constable Jack of Point Fortin CID is investigating.

Winds spark rogue 19.5m wave off Tassie

22nd September 2006, 14:23 WST

Gale force winds have produced a massive 19.5-metre wave off the coast of Tasmania, according to surf forecasters.

The rogue wave was recorded about 9am (AEST) on Thursday and is believed to be one of the largest ever measured in Australia, forecasters say.

Swellnet website forecaster Ben Matson said a wanderer buoy located 10 kilometres from Cape Sorell, on Tasmania's west coast, recorded a wave peaking at a height of 19.5 metres (64 feet) as westerly winds crossed the coastline.

"It was probably a combination of several waves that all combined at the one time to produce this single enormous wave," he said.

"Large swells are common in the Southern Ocean at this time of year but wave heights of this magnitude are extremely rare."

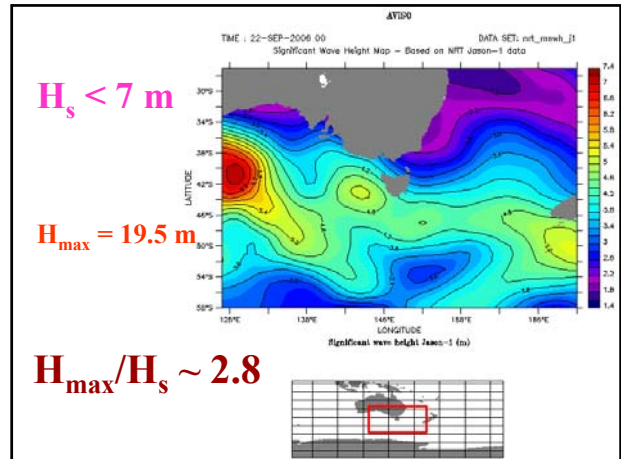

Mr Matson said waves of that size had the potential to cause significant damage to ships and had been known to "send oil tankers to the bottom of the ocean" in other parts of the world.

Forecasters were currently examining old data but Mr Matson said the wave could be the largest ever measured in the country.

Tasmania was battered by strong winds for a second successive day on Friday as cold fronts and a deep low pressure system passed around the state.

Winds reached up to 160kph on Mabsbury Island, on Tasmania's south coast, on Thursday and hit a high of 140kph at Scotts Peak dam in the state's south-west just before 8am on Friday.

Three boats ran aground, almost 10,000 homes lost electricity and several roads were blocked across the state as strong winds raged.

Killed by a freak wave

Sep 25 2006
By Eryl Crump, Daily Post

A JET-SKIER was killed after he was knocked off his machine by a huge wave off the North Wales coast.

The man was riding off Porth Ceiriad, near Abersoch, on Saturday when the freak wave struck at around 4pm.

He was picked up by an RNLI lifeboat and airlifted to hospital in Bangor but later died.

Two dead as massive wave hits cruise ship Louis Majesty in Mediterranean

- From: AP
- March 04, 2010 8:43AM

A MASSIVE 8m-plus wave has smashed into a cruise ship carrying nearly 2000 people in the Mediterranean, smashing glass windshields and killing two passengers

Another six people suffered light injuries, the Greek coast guard said in a statement. The victims were identified as a German and an Italian man.

The ship asked for permission to dock in Barcelona and arrived at the Spanish port shortly after 9 p.m. local time, the Spanish news agency Europa Press said.

There, four ambulances were waiting to take the bodies and the injured to a hospital in the city, the agency said.

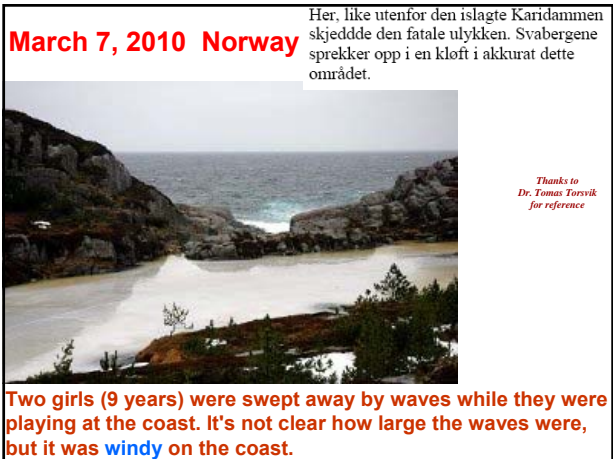

No further details on the dead or the injured were immediately available. Spanish reports said the injured included a 62-year-old woman who broke both of her legs.

It was unclear late Wednesday exactly where the incident took place. The Greek coast guard said the accident occurred near the French Mediterranean port of Marseille as the Cypriot-owned Louis Majesty was sailing from Barcelona to the Italian city of Genoa with 1,350 passengers and 580 crew members on board.

The sea-state reported by the Cap Begur buoy, just next to the casualty at the time of the accident (14h15TU) was **5 m**. It seems that the slightly change in the direction of 2nd wave just after the ship has plunged in the 1st trough of **a bigger wave associated with a high steepness** is responsible for the hurt. So, the **Freak character of the event is rather related to the shape**, the direction of the waves, the presence of several bigger waves, the position of the ship, than to the **ratio of the maximum wave height (reported to 8m, but maybe a little more) versus the significant wave height (5m)**.

Meteo France

June 26, 2010 Cassis, France

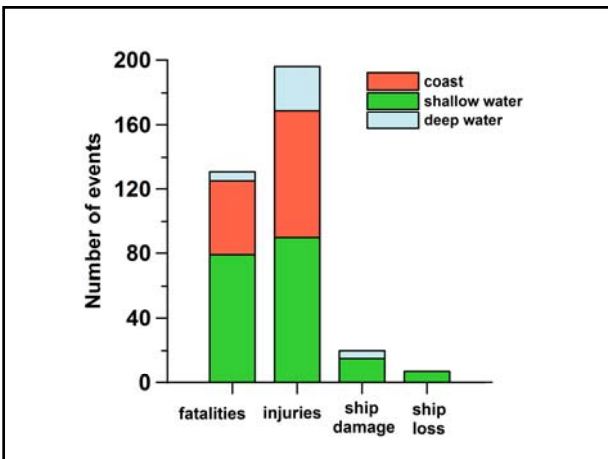

Four waves of height 50-80 cm climbed on beach on distance 8 m washed out many dresses. It occurred on small beach near the port of Cassis (on right). Sea was with no waves and clear water. After water was with sediment

Rogue Waves in 2006-2010
(Nikolkina & Didenkulova, 2011)

(Mass-Media)

Why does large wave appear?

Wind wave field is quasi-Gaussian random process

Statistical approach:

- needs long-term time series (it is possible now)
- but always will be incorrect for extreme values of amplitudes (its level will increasing with duration of record)

Physical (Dynamical) approach:

- leads to find conditions when freak waves can appear

Mechanisms:

- **Wave – current interaction**
 - wave blocking,
 - random caustics.

Wave – Current Interactions

- ❑ **Blocking on opposite current**

$$\omega = \sqrt{gk} + k\bar{U}(x, y)$$

blocking at $c_{gr} = -U(x)$

Models: energy balance equation, nonlinear Schrodinger equation

- ❑ **Random Caustics**

Wave – Current Interaction

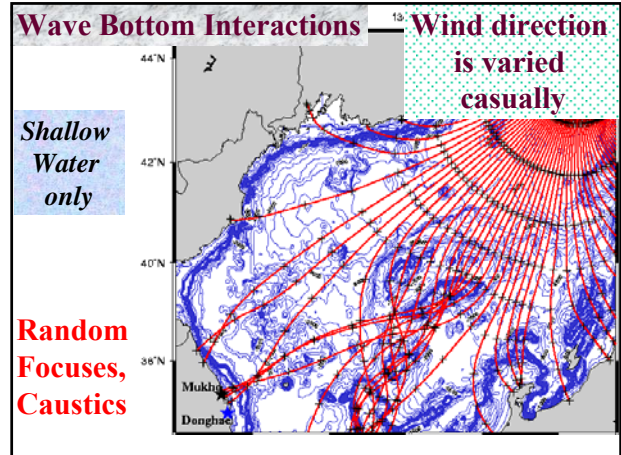

Indian River Inlet, Delaware, USA

Mechanisms:

- **Wave – current interaction**
 - wave blocking,
 - random caustics.
- **Wave – bottom interaction**
 - focuses, shallow water only
 - random caustics.

Mechanisms:

- **Wave – current interaction**
 - wave blocking,
 - random caustics.
- **Wave – bottom interaction**
 - focuses, shallow water only
 - random caustics.
- **“Itself” wave dynamics**
 - temporal-spatial focusing

Geometrical Focusing

Dispersion Enhancement

Physics: Phase speed is $c_{ph}(k)$

Dispersion Enhancement

Physics: Phase speed is $c(k)$

Kinematic Model

$$\frac{\partial \omega}{\partial t} + c_{gr}(\omega) \frac{\partial \omega}{\partial x} = 0$$

$$\frac{\partial c_{gr}}{\partial t} + c_{gr} \frac{\partial c_{gr}}{\partial x} = 0$$

$$c_{gr}(\omega) = \frac{x - x_0}{t - T}$$

Increased wind

Who is **responsible** for frequency modulated wave Focused in the **Freak Wave** ?

Of course, WIND

But variable wind!

Waves are generated by resonant wind:

$$c_{ph}(k) \sim W$$

Light Wind generates Slow (Short) Waves,
Strong Wind generates Fast (Long) Waves.

And Long Waves overtake Short Waves (Focusing)

Kinematic Model: Amplitude

$$\frac{\partial c_{gr}}{\partial t} + c_{gr} \frac{\partial c_{gr}}{\partial x} = 0 \quad \frac{\partial A^2}{\partial t} + \frac{\partial}{\partial x} (c_{gr} A^2) = 0$$

$$c_{gr}(x, t) = c_0(\xi) = c_0(x - c_{gr} t)$$

$$A(x, t) = \frac{A_0(\xi)}{\sqrt{1 + t(dc_0/d\xi)}}$$

infinity in focus

No valid in focus

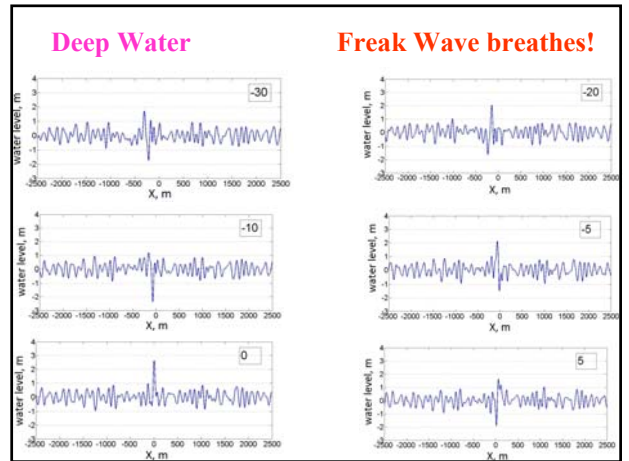

- Mechanisms:**
- **Wave – current interaction**
 - wave blocking,
 - random caustics.
 - **Wave – bottom interaction**
 - focuses, shallow water only
 - random caustics.
 - **“Itself” wave dynamics**
 - temporal-spatial focusing,
 - modulation instability. deep water only

Nonlinear waves in deep water

Rogue waves made of light

Freak waves in an optical system might help to explain those at sea.

[Philip Shaw](#)

Gigantic 'rogue' waves that swallow ships have been brought into the laboratory. No one knows exactly how they form in the ocean, but a team at the University of California, Los Angeles, has made similar freak events in light¹. The researchers say that their work should help to explain this terrifying maritime phenomenon.

Rogue waves were originally thought to be a myth. Lone waves tens of metres high had been described as sailors' anecdotes, but it wasn't until the mid-1990s that they were documented convincingly. One such wave struck an oil platform in the North Sea in 1995, another was photographed in 1993 in the Bay of Biscay.

There have been more sightings since. In 2001, for example, a passenger ship in the South Atlantic was hit by a wave about 30 metres high. Yet conventional theories of ocean waves predict that these monsters should be so rare that they would effectively never be seen.

It's now recognized that the ocean defies those theories. Most waves are small; the bigger the wave, the rarer it is. But there is still an anomalously high number of extremely big waves. It isn't clear why.

Various explanations have been proposed, involving natural wave-focusing effects or freak winds. A key feature of rogue waves is that they stay as sharp peaks as they move, making them look like 'walls of water'. This is similar to 'self-reinforcing solitary waves' or solitons, which can sweep over large distances without dispersing, keeping the same size and shape.

Solitons were first observed in a Scottish canal in the nineteenth century. They are now well studied in light as well as in water. So Daniel Solli and his colleagues wondered whether they could use the techniques known to generate optical solitons to make rogue waves in light.

Wave of light: you can get freak peaks in optical systems. Getty

Vector rogue waves in binary mixtures of Bose-Einstein condensates

Yu.V. Bludov^{1,a}, V.V. Konotop^{2,b}, and N. Akhmediev^{3,c}

You are kindly invited to participate in the session NH5.2/NP7.4/OS5.5 - "Extreme Sea Waves" at the General Assembly of the EUROPEAN GEOSCIENCES UNION to be held in Vienna, Austria, 3-8 April 2011.

The aim of the session is to describe all aspects of the large-amplitude wave phenomenon in the ocean as the freak, rogue and storm waves: dynamical and statistical theories, observations and modelling, numerical simulations in the framework of approximate theories as well as full nonlinear equations. Special attention will be paid to the description of the wave breaking process, and also large-amplitude wave interaction with coastal structures. The rogue wave phenomenon of any physical nature will be discussed also.

MAX-PLANCK-INSTITUT FÜR PHYSIK KOMPLEXER SYSTEME
VISITORS PROGRAM
DR. SERGEI FLACH

Rogue Waves 2011

1-8 November, 2011, Dresden, Germany

Chairmen:

Nail Akhmediev, Canberra, Australia

Allan Newell, Arisona, USA

Efim Pelinovsky, Nizhny Novgorod, Russia

Conclusions for Ocean:

Freak Wave Phenomenon is a subject of Modern Physics and Engineering

Several mechanisms result to freak wave appearance

Tasks:

Statistics of freak waves: physics and geography

Moral of the Lecture:

Never underestimate

the unpredictability

of rough seas
